Patient: Hello doctor, I've been having a fever on and off for this whole week, and I've been coughing constantly. I have phlegm but can't cough it out easily. My throat also hurts. ...

Doctor: …How old are you? What do you do for work? Before this illness started, did you have contact with anyone who had a cold or fever, or did you experience getting chilled or overwork?

Patient: I'm 32 years old, working as an office clerk in a company. I did work overtime quite a bit in the days before getting sick, so I was pretty tired. I'm not sure if I had contact with anyone with a cold.

Doctor: Well, after overwork, the body's vital qi is deficient, making it easy to be affected by external pathogens. When you first got sick, did you first feel chills or fever? Did you have any body aches, nasal congestion, or runny nose?

Patient: At first, I just felt feverish, and my temperature was 38 degrees. I didn't have obvious chills or shaking, nor did I have body aches. My nose was fine, just my throat hurt.

Doctor: So that means fever was more prominent, without obvious aversion to cold, and no nasal congestion or runny nose, with fever and sore throat as the main initial manifestations, right? Did you have sweating?

Patient: Right, not much sweating. After taking antipyretics, I sweated a bit and my temperature came down.

Doctor: Okay. During these seven days of fever, what was the highest temperature you reached? Was it continuous fever or intermittent? How high did it get again last night?

⋮

Patient: I feel dry mouth and want to drink water. I prefer cold drinks, they make me feel more comfortable.

Doctor: Do you feel restless heat in your body and irritability? How are your urination and bowel movements?

Patient: I am a bit irritable and my sleep is not very good. Urination and bowel movements are okay; urine is yellowish, stool is normal.

Doctor: Let me take a look at the test results you had earlier. The chest X-ray shows inflammation in the upper left lung, and the lung CT also indicates inflammatory changes in the left upper lobe.Given your recurrent fever, cough, and yellow thick phlegm, a lung infection is clear. Let me ask further:...

⋮

Patient: My bowel movements are fine, not dry, and my abdomen is not distended.

Doctor: If there are no signs of bowel repletion, **it indicates that the heat pathogen is mainly in the lung and has not yet combined with intestinal waste to form phlegm-heat bowel repletion**.
Alright, after a detailed consultation and analysis, here is a summary. **Your diagnosis is Wind-Warmth (a lung-heat disease). The core pattern is phlegm-heat obstructing the lung. The main basis for pattern identification is as follows: ...**
